fyaseen846@gmail.com | [linkedin.com/in/faissal-yaseen-b0604a2b2](https://www.linkedin.com/in/faissal-yaseen-b0604a2b2) | github.com/faissalyaseen | Islamabad, Pakistan

PROFESSIONAL SUMMARY

Cybersecurity student specializing in SOC automation, threat intelligence, and SIEM engineering. Hands-on experience building automated phishing detection pipelines, brand abuse monitoring systems, IOC enrichment workflows, and fraud campaign detection platforms. Proficient in Python-based security tooling, log analysis, and integrating threat feeds into investigation workflows. Pursuing a career in SOC automation and threat intelligence operations.

EDUCATION

FAST National University of Computer and Emerging Sciences

Islamabad, Pakistan

Bachelor of Science in Cybersecurity

Aug 2022 -- Jun 2026

- Relevant Coursework: Network Security, Digital Forensics, Web Security, Cryptography, AI/ML for Security, Penetration Testing
- Final Year Project: AdvML-Shield -- Adversarial robustness framework for AI-based malware detectors with post-quantum secure reporting (CRYSTALS-Kyber/Dilithium)

TECHNICAL SKILLS

SOC & Threat Intelligence: IOC enrichment, phishing analysis, domain threat hunting, brand abuse detection, fraud campaign correlation, OSINT

Security Tooling: VirusTotal, Shodan, WHOIS/RDAP, SSL certificate analysis, Tesseract OCR, EasyOCR, Selenium

Programming: Python (expert), FastAPI, Flask, Bash scripting

Data & Storage: MongoDB, Firebase, REST APIs

ML / CV for Security: OpenCV, SSIM, pHash, CNN-based logo detection, SimHash, Adversarial Robustness Toolbox (ART)

Forensics & Crypto: NTFS/MFT analysis, WinHex, post-quantum cryptography (liboqs-python), AES-256

Platforms: Linux, Windows, Kaggle, n8n workflow automation

PROJECTS

Phishing Detection & Threat Intelligence Platform | Python, Flask, Selenium, MongoDB

- Engineered an end-to-end phishing investigation platform automating triage of malicious domains and brand impersonation campaigns, reducing manual analyst effort for IOC investigation.
- Built automated enrichment pipeline collecting DNS records, WHOIS intelligence, SSL certificate metadata, and domain registration artifacts to generate structured threat reports per domain.
- Implemented typosquatting domain generation (homograph, keyboard-proximity, TLD substitution variants) to proactively identify lookalike domains targeting legitimate brands.
- Built multi-source IOC correlation engine combining domain reputation, certificate transparency logs, and infrastructure pivoting indicators to support analyst investigation workflows.
- Developed webpage cloning detection using DOM similarity scoring, CSS fingerprinting, and SimHash to identify visually replicated phishing sites with >90% structural match accuracy.
- Integrated OCR-based brand extraction (Tesseract + EasyOCR) and SSIM screenshot comparison to automate brand abuse identification from phishing page visual content.
- Created SOC investigation dashboards for historical IOC tracking, phishing campaign timeline analysis, and analyst case management.

Mobile Clone Application Intelligence Framework | Python

- Built an automated threat intelligence framework to detect malicious clone applications distributed through unofficial channels targeting legitimate organizations.
- Developed data collection pipelines ingesting application metadata, screenshots, icons, and textual descriptions from public app repositories for threat analysis.
- Implemented multi-signal similarity scoring (icon hash comparison, description NLP similarity, package name analysis) for clone detection with risk-based prioritization.
- Integrated findings into threat intelligence workflows supporting Digital Risk Protection (DRP) and brand abuse investigation operations.

Brand Abuse Monitoring & Visual Threat Detection System | *Python, OpenCV, Computer Vision*

- Developed automated brand monitoring platform detecting logo misuse and impersonation campaigns across web and social media surfaces for proactive threat intelligence.
- Implemented layered visual analysis pipeline: perceptual hashing (pHash) for fast screening, SSIM for structural similarity scoring, and CNN-based logo comparison for precision brand matching.
- Built OCR-driven brand name extraction combined with fuzzy string matching to identify unauthorized textual brand usage in advertisement creatives and fraudulent web pages.
- Automated IOC collection and indicator packaging to feed downstream threat intelligence platforms and fraud investigation case management systems.

Fraud Campaign Detection & Correlation System | *Python*

- Designed automated detection workflows identifying fake giveaway campaigns, recruitment scams, and financial fraud operations across social and web platforms.
- Built indicator correlation engine applying rule-based analytics to cluster related IOCs, link infrastructure overlap, and surface coordinated inauthentic behavior patterns.
- Developed structured investigation pipelines exporting enriched intelligence reports for ingestion into SIEM platforms and threat intelligence sharing workflows.

Email Threat Analysis & SOC Alert Enrichment System | *Python, Gmail API, Firebase*

- Built automated email analysis solution parsing raw email headers, body content, and attachments to identify phishing attempts, BEC patterns, and malicious URLs.
- Implemented multi-factor risk scoring engine evaluating sender reputation, domain age, link redirection chains, and header anomalies to generate SIEM-ready structured alerts.
- Developed automated notification and escalation workflows enabling SOC analyst rapid awareness and prioritized triage response for high-risk email threats.
- Integrated phishing URL extraction with threat feed lookups to enrich alerts with real-time IOC context for analyst investigations.

AdvML-Shield: Adversarial Robustness Framework for AI Malware Detectors | *Python, ART, liboqs*

- Designing adversarial malware sample generation pipeline using FGSM and PGD attacks (via Adversarial Robustness Toolbox) against CNN-based malware classifiers trained on EMBER dataset.
- Implementing adversarially trained robust detector to maintain detection accuracy against evasive malware samples designed to bypass ML-based security controls.
- Integrating post-quantum secure threat reporting using CRYSTALS-Kyber (key encapsulation) and CRYSTALS-Dilithium (digital signatures) via liboqs-python for tamper-evident findings delivery.
